

Biofuel - A New Technological Approach

I am qualified organic chemist and technologist. We're a small company interested in finding of contact for investor in the matter of the following project. It's related to investment for laboratory testing of certain amount of appropriate catalysts for getting liquid highly unsaturated hydrocarbons suitable not just as a biofuel for present Diesel combustion engines but as a input raw material for chemical and pharmaceutical industry. All on the base of natural inexhaustive and renewable resources. We're expecting approximately one calendar year period for this testing. We are offering cooperation and profit sharing in a new future company if this project will be accomplished successfully. Project was a part of application form in the spring 2007 that asked government and Grant Agency of the Czech Republic for financial support. Chemically this project related to connection of catalytic front-end regioselective dehydrogenation reaction of fatty acids with following spontaneous decarboxylation into the just one continuous technological step. For more details see please attachment. Unfortunately expense budget of the Czech Republic for science and development was restricted from 2007 and situation is not better until now. That's why we're focusing a private sector of financial sources. In the case of your interest contact us on [+44 \(0\) 7914000794](tel:+44207914000794) or e-mail on skodamartin@hotmail.co.uk or j_navratil@volny.cz. Thank you for your interest and eventual response.

Best Regards
Mr. Mgr. Martin Skoda
Author and Leader of the Project
